I thank you for the information on the post mortem analysis of the tissues from [Redacted - EU PII] for paraquat are very similar to those obtained by us for the [Redacted - EU PII] gent who, I believe died within 48 hrs and also for an experimental monkey which died within 48 hrs after 100 mg/kg paraquat. The results from the relevant tissues I have tabulated below for a comparison. (Expressed as ug per g).

	[Redacted - EU PII]	[Redacted - EU PII]	Monkey
Liver	17	18.8	20.7
Kidney	21	26.1	33.4
Lung	20	No specimen	11.5
Brain	1	8.6	1.3

The other interesting observation from the results for [Redacted - EU PII] is that both paraquat and diquat appear to be adsorbed on to tissues in similar concentrations.
